Box and Cox (1964) developed the transformation. Estimation of any Box-Cox parameters is by maximum likelihood. Box and Cox (1964) offered an example in which the data had the form of survival times but the underlying biological structure was of hazard rates, and the transformation identified this.

### **Glossary of research economics - econterms**

Stock splits are events that increase the number of shares outstanding and reduce the par or stated value per share. For example, a 2-for-1 stock split would double the number of shares outstanding and halve the par value per share.
